SUMMARY

The Biotechnology Industry Organization (BIO) appreciates this opportunity to provide the perspective of its members on the Bayh-Dole Act. BIO represents over 1,100 companies, universities and research institutions using biotechnology to research and develop cutting edge healthcare, agricultural, industrial and environmental products and applications.

The biotechnology industry is one of the most R&D-intensive and capital-focused industries in the world. The industry is primarily made up of small companies that are unprofitable and that lose billions of dollars annually. Yet it holds the promise for a cutting edge cure for Alzheimer's, drought resistant crops, or the next alternative energy source. With over 1,400 companies, many of which spun out of university research, the U.S. leads the world in biotechnology R&D. In 2005, the U.S. biotech industry spent \$20 billion on research and development, and since its inception roughly two decades ago, has put into the hands of the public more than 300 biotech products, including life-saving and life-enhancing healthcare treatments, and hundreds of diagnostic tests. The industry has already developed dozens of insect-resistant crops and environmentally friendly industrial applications.

All of this accomplishment has occurred despite the decades-long development time, massive investment needs, and complex regulatory process the industry must face before bringing its products and applications to market. The Milken Institute, in a 2006 report entitled "Mind-to-Market: A Global Analysis of University Biotechnology Technology Transfer and Commercialization," identified five key factors that contribute to the successful commercialization of university biotechnology research: a consistent and transparent national innovation policy that recognizes intellectual property protection and promotes entrepreneurial capitalism; the availability of funding and venture capital; biotechnology clusters not restricted by geographic borders; robust university technology transfer mechanisms; and patents and licensing.

The U.S. system of commercializing scientific discoveries has made it the world leader in the area of biotechnology in large measure because it takes into account the factors identified by the Milken Report. However, this was not always the case. Indeed, rapid commercialization of scientific discovery did not fully come about until the enactment of the Bayh-Dole Act in 1980. Prior to enactment of this legislation, publicly-funded research was owned by the government and offered for licensing on a non-exclusive basis or simply dedicated to the public. There was little incentive for businesses to undertake the financial risk to develop a product. The result was that only 5% of publicly-funded discoveries were ever developed into new or improved products. ii The Bayh-Dole Act

allowed universities and research institutions to patent and retain title to their inventions. Moreover, the Act allowed for flexibility in licensing of publicly-funded inventions without excessive government intervention. The motivation to license the technology in expectation of royalty payments was created. This provided a necessary impetus for the transfer of publicly-sponsored research to the private sector, thereby dramatically stimulating the commercialization of federal government-supported research. The result, among other things, is the existence of innovative new therapeutics, diagnostics and tools, industrial processes and agricultural products for the benefit of society.

From the perspective of the biotechnology industry, over the past 25 years the Bayh-Dole Act has accomplished more than its goal of turning publicly-funded research into useful, commercial products. It has also served as a basic tool for economic development and job creation in the United States. In its policy statement on July 24, 2007, the National Governors Association recognized the import of Bayh-Dole and university technology transfer as catalysts for innovation and R&D.

The Bayh-Dole Act has become a template for innovation and economic development for other enterprising countries such as India and China. The Milken report shows that, while universities in the United States have clearly set the standard in commercializing research, other countries, particularly in Europe and Asia, have recognized the role of universities in spurring the biotechnology industry. The study suggests that, in order for the U.S. to maintain its leadership in innovation, it must continue to fund research and university technology transfer offices, encourage the transfer of innovative research to the private sector, and ensure strong intellectual property (IP) protection.

BIO applauds this Committee's oversight of this critically important Act to ensure that the next 25 years of Bayh-Dole provide even greater benefit to the American public and the world community. In its oversight capacity, this Committee should carefully consider how pioneering policies like the Bayh-Dole Act have helped to create the biotechnology industry and U.S. leadership in this area, as well as the broader economic and societal benefits from the Act.

The Role of Patents in Biotechnology

In BIO's view, efficient technology transfer is intricately linked to strong IP protections and free market incentives. In the context of the Bayh-Dole Act, patents serve as the legal instrument used in the transfer of technology, information and know-how. Commercializing an invention in the biotech sector is a lengthy process requiring significant amounts of capital, often in the hundreds of millions of dollars. While government funding and research is critical in biotech R&D, substantial additional financing from the public and private capital markets is required to actually take the product from the idea stage to one that can be used by the public. Let's take as an example a typical healthcare-related biotech discovery. A researcher, typically in a

publicly-funded laboratory, discovers a gene whose presence is only found in a particular type of cancer. The researcher also determines that the presence of this gene signals the presence of a quantifiable amount of a particular protein. Translating this initial discovery into a therapeutic application can take decades and hundreds of millions of dollars. However, it is at this early stage when the promise of a therapy is on the horizon that the researcher can seek patent protection on the various aspects of the discovery. By way of a patent, the researcher can generate interest in the further development of this potential new product by, for example, out-licensing the invention, or forming a spin-off company focusing on the R&D of this early-stage discovery. In both cases, the patent is the asset that creates a forward trajectory for the project. In the former case, an interested company partner would, among other things, review the strength and scope of the IP protecting the early-stage discovery to determine the worth of the investment. In the latter case, the IP generates the interest of institutional investors, venture capitalists, or other partners encouraging the creation of an early-stage company. In any event, the earlystage, publicly-funded discovery is now on its way to development. Of course the road to development from this point is long and torturous, and often fraught with set backs, but the transfer of technology is complete and the wheels are set in motion.

From this point on, patents play a significant role in investment of capital in the biotechnology markets. Investors measure opportunities in the biopharmaceutical and pharmaceutical sector through potential sales of the drug/product, the market exclusivity prospect through patent protection, other forms of marketing exclusivity (such as orphan drug exclusivity), or other means to gauge the strength and predictability of patent protection.

The ancillary benefits of this ecosystem to the economy in the form of jobs, tax revenue and new companies should not be overlooked. According to the Association for University Technology Managers' (AUTM) annual reportⁱⁱⁱ, the Bayh-Dole Act continues to create hundreds of companies and tens of thousands of new jobs annually. Virtually every state has a biotechnology center or initiative.

If the major policy objective of the Bayh-Dole Act is to use the patent system to promote the commercialization and utilization of inventions arising from federally-supported research or development, then the biotechnology sector is an exemplary measure of its success. The Bayh-Dole Act provides the environment for biotechnology companies to take the risk of investing in biotechnology R&D. It provides the lure of market exclusivity as the incentive for companies to work in cooperation with public institutions. There is little misunderstanding of the primary obligation that companies have under Bayh-Dole to *commercialize* the licensed technology. This point is solidified by the statute's provision that failure to commercialize a licensed federally-funded invention can be the basis for government march-in rights.

While BIO believes that the Bayh-Dole Act is working quite well, there are ways to ensure that maximum benefit is continually derived from its provisions. As an example,

BIO urges that the patent system should be kept strong and predictable. Congress is currently considering patent reform legislation that, in its current form, could negatively impact commercialization of publicly-funded research by undermining the strength, value, and predictability of patent protection. This would, in turn, make it much less likely that companies and venture capital companies would invest in risky, cutting-edge research, resulting in publicly-funded research sitting on laboratory shelves. BIO recently testified before the Senate Judiciary Committee about its views on patent reform, and the university technology transfer community has weighed in with similar concerns.^{iv}

In addition, consistent and transparent implementation of the Bayh-Dole Act, together with a cataloguing of "best practices" and successful partnerships, would provide more efficient transfer of technology. Congress should consider funding studies that would aid in the identification and compilation of such best practices and identify how best to support the technology transfer offices in their overall mission.

In this spirit, BIO cautions against policies that would weaken market incentives through excessive government intervention. We can point to lessons learned in the 1990s in studying the Bayh-Dole Act. Concerns that healthcare reform proposals from the early 1990s could lead to price controls led to serious perturbations in the market for biotechnology investment. The impact of potential price controls on the biotechnology industry was immediate and powerful. The capital markets crashed and investment in biotech research nearly dried up.

A similar result occurred in 1999 when President Clinton and Prime Minister Blair were cited in the press as supporting the notion that certain classes of patented genetic information should be freely available to all at the time the human genome was "unraveled." Despite a clear correction by the President the next day, it took six months for the biotechnology capital markets to recover.

In both cases, a threat to free-market protection and undermining intellectual property rights drove investors away from biotechnology research. The Bayh-Dole Act was designed to facilitate the transfer of publicly-funded research to the private sector for further development and commercialization. The careful balance set forth in the Act has been hugely successful. We have learned from history that excessive government intervention can disincentivize biotechnology companies from undertaking the huge risks to bring innovative products and services to all Americans.

CONCLUSION

The legislative framework of the Bayh-Dole Act has worked well over these 25 years. The House Committee on Science and Technology is to be commended for undertaking this examination of the Bayh-Dole Act. BIO appreciates the opportunity to provide insight into the impact of Bayh-Dole on the biotech industry and to describe the nature of

the industry and its contributions to the improvement of the human condition. BIO's members are strong supporters of the Bayh-Dole Act, which has opened the door to the creation of many biotechnology companies that have developed important advances and cutting-edge solutions to some of the world's most intractable problems. We caution against policies that would weaken market incentives through excessive government intervention. We urge Congress to continue its far-sighted approach to innovation as it continues oversight of the effective implementation of the Bayh-Dole Act.
